Scope of investigation

1

Domain Query for nameserver identification

1

Following the chain

1

DNS zone configuration at the end of the chain

2

Solution Recommendation

2

More information about domaincontrol.com

4

Purpose

To identify why Azure DNS settings are not being used when accessing diadon.com

Scope of investigation

Domain name: diadon.com

Expected DNS end-of-chain DNS server(s): Azure DNS

The investigation was conducted following the same series of steps that any internet request would follow

- Domain query for nameserver identification
- Following DNS chain nameserver chain
- DNS zone configuration at the end of the chain

Domain Query for nameserver identification

Whois.net was used to identify the nameservers that would handle the start of any request.

The initial lookup identified NS51.DOMAINCONTROL.COM and NS52.DOMAINCONTROL.COM as the nameservers for diadon.com. Note that other registration information does not immediately identify the owner of the domain. This is a result of domain privacy settings.

Following the chain

Following the DNS chain and looking up diadon.com in ns51 and ns52 at domaincontrol.com resulted in zero records with the nearest match being diodonnodmcc.com

This is the end of the DNS chain as there is no additional route specified beyond this point.

DNS zone configuration at the end of the chain

Azure DNS is not the end point in the lookup chain which is why it is not handling lookup requests for diadon.com

Solution Recommendation

The nameservers specified in the domain name registration records should be changed to point to azure ns servers, not domaincontrol ns servers. This change must be made in the domain registrar's system (<http://worldics.com/>).

See the example below for ns server details that should be visible when performing a whois on diadon.com

NOTE: the example below show -07 Azure DNS servers but for diadon.com, -09 servers will be used:
NS1-09.AZURE-DNS.COM, NS1-09.AZURE-DNS.NET, NS1-09.AZURE-DNS.ORG and NS1-09.AZURE-DNS.INFO
